# OPTOELECTRONIC SAFETY GUARDS

 **SCHMERSAL**  
THE DNA OF SAFETY

# INTRODUCTION

**Heinz and Philip Schmersal,**  
Managing Directors of the Schmersal Group

## **New solutions to improve production efficiency and machine safety**

### **Safety in system – Protection for man and machine**

Often, it is unavoidable that people have to intervene with the workings of a machine. When this is done, the safety of the operator is imperative. This demands the responsibility of the machine operator, which is also required by the world's standards and guidelines for machine safety.

The Schmersal Group has concentrated for many years on safety at work with our products and solutions; today we can offer the industry the world's largest range of safety switchgear and systems for the protection of man and machine.

Under the guiding principle "Safety with system – protection for man and machine" we develop and produce products that carry the system concept and can be optimally integrated into the work processes. Because we are convinced that safety does not contradict higher productivity.

In our fields of activity we have a leading position due to our expertise, our innovative power and our comprehensive range of products. With this we follow a central theme: Together with you, we want to make the world safer.

Talk to us – we look forward to working with you.

# SCHMERSAL WORLDWIDE OFFICES IN GERMANY

## WUPPERTAL

### K.A. Schmersal GmbH & Co. KG

- Founded in 1945
- Around 710 employees

#### Focal points

- Headquarters of the Schmersal Group
- Development and manufacture of switchgears and switching systems for safety, automation and lift engineering
- Accredited test laboratory
- Central research and development
- Logistics centre for European markets

## WETTENBERG

### K.A. Schmersal GmbH & Co. KG

- Founded in 1952 (1997)
- Around 130 employees

#### Focal points

- Development and manufacture of switchgears for operation and monitoring, safety-related relay modules and controls as well as switchgears for explosion protection

## MÜHLDORF / INN

### Safety Control GmbH

- Founded in 1994 (2008)
- Around 30 employees

#### Focal points

- Development and manufacture of optical electronic components for safety and automation engineering

## BERGISCH GLADBACH

### Böhnke + Partner GmbH Steuerungssysteme

- Founded in 1991 (2013)
- Around 90 employees

#### Focal points

- Development and manufacture of components, controls and remote diagnostic systems for the lift industry

( ) = inclusion in the Schmersal Group

# SCHMERSAL WORLDWIDE INTERNATIONAL OFFICES

## BOITUVA / BRAZIL

### ACE Schmersal

- Founded in 1974
- Around 400 employees

### Focal points

- Manufacture of electromechanical and electronic switchgears
- Customer-specific control systems for the North and South American market

## SHANGHAI / CHINA

### Schmersal Industrial Switchgear Co. Ltd

- Founded in 1999
- Around 150 employees

### Focal points

- Development and manufacture of switchgears for safety, automation and lift engineering

## PUNE / INDIA

### Schmersal India Private Limited

- Founded in 2013
- Around 60 employees

### Focal points

- Development and manufacture of switchgears for safety, automation and lift engineering

# OPTOELECTRONIC SAFETY DEVICES

## DESCRIPTION

### USAGE / SELECTION OF AOPD

In order to choose the appropriate active optoelectronic protective device (AOPD) such as light barriers or light curtains/grids to use them correctly, both the requirements of the standards (EN ISO 13849-1, EN ISO 13855, C standards etc.) and product-specific features (detection sensitivity, range, etc.) must be taken into account.

AOPD's can be used, provided that:

- The dangerous movement can be stopped at all times and that it is ensured that the dangerous area can only be reached after the movement has come to a standstill.
- The stopping time for the machine and all safety components used are known.
- No objects (work pieces, liquids, etc.) can be ejected.
- The AOPD meet the requirements of Type 2 or Type 4 acc. to EN 61496.
- The dangerous area can only be reached by passing through the protected field of the AOPD.
- Reaching over, under or through the protected field is impossible.
- The start or restart command devices are fitted in such a way that the entire hazardous area is completely visible from the outside and it cannot be activated from within the hazardous area.
- The safety distance is calculated and constructively applied in accordance with EN ISO 13855.

The effectiveness of the protection equipment is only as good as the risk analysis carried out when designing the system, which took into consideration all the marginal conditions such as surroundings, machine and functional sequences.

### SAFETY LIGHT GRIDS / LIGHT CURTAINS

The safety light curtains and safety light grids of the SLC and SLG range meet the requirements of Category type 2 and type 4 according to EN 61496. Typical applications for safety light barriers are on robots, automatic-processing plants, transfer lines, rack storage and pallet loaders. If the light beam is interrupted by an object or a person, a stop signal is emitted to bring the machine to standstill.

The protection field is defined by the height and width of the protection field. The protected height is the range between the first and last infrared light beam of a light curtain. The protected width or operating range is the distance between the emitter and receiver unit. If the light beam is interrupted, a signal is emitted to bring the dangerous movement of the machine to a standstill.

For the detection of body parts, a distinction is made between finger, hand and body protection. EN ISO 13855 sets the biometric data for finger protection to 14 mm, for hand detection to 30 mm, for leg detection up to 70 mm and for body detection to over 70 mm. Safety light grids are generally used to detect the penetration of the entire human body.

The safety light grids and light curtains can be smoothly connected through a M12 connector; they are equipped with a diagnostic interface as well as an LED for status indication. The safety light curtains or light grids feature an integrated safety-monitoring module with start/restart interlock and contactor control. Additional functions such as blanking, muting and a synchronisation function for the light curtains are also available. Today with Bluetooth® LE an innovative communication interface is available for the diagnosis and inspection of AOPD. The current AOPD data of the SLC440 and SLC440COM series are displayed in real time.

## SAFETY LIGHT CURTAINS WITH BLUETOOTH® INTERFACE BLE

"SLC Assist" for iOS

"SLC Assist" for Android

### The App "SLC Assist"

The App gives information about

- Operating mode
- Beam signal level
- OSSD status
- Status of the protective field
- Number of OSSD switches
- Supply voltage
- Operating time

Beam signal level:

★★★ = perfect alignment

☆☆☆ = optimisation required

You will define the service cycles for the safety relay module via the OSSD switching counter. The information of the total operating time is the basis for planning the periodic inspection.

### Innovative Technology

The light curtain with Bluetooth® interface and the SCHMERSAL App gives optimal support for

- Condition monitoring
- Optimal alignment
- Preventive maintenance
- Documentation according to industrial safety regulations

The SCHMERSAL App "SLC Assist" is available for Android and iOS devices.

More information can be found in the product video.

# OPTOELECTRONIC SAFETY DEVICES

## MODES OF OPERATION AND FUNCTIONS

### SAFETY LIGHT BARRIERS

All SLB photoelectric barriers have fail-safe integrated semi-conductor outputs (2 x PNP) and can be incorporated directly in the safety circuit without external safety monitoring. The new product family meets the requirements of all type 2 or type 4 applications in accordance with EN 61496. The safety photoelectric barriers are distinguished by extremely small dimensions which means that they can be well placed in the surrounding structure and can also be mounted easily and quickly even in tight spaces. Both models have a range of 15 metres. The SLB 440...-H model features a range of up to 75 metres and, as an option, has integrated heating for use in minus temperatures.

Single beam photoelectric barriers are particularly suitable for safeguarding smaller hazardous areas – such as machines with small openings or slots.

With this set of features, the new photoelectric barriers can be deployed in numerous ways – for example in work areas where assembly and material handling technology is used as well as in the wood, paper and print industry. Other areas of application are (semi) automated shelving and commissioning systems, high shelf warehouses and packaging machines as well as for confining work areas of man and machine. It can also be used in outside areas, for example in the wood and cement industry, in gravel pits or in harbours/ports.

### OPERATING MODES

Double reset

The operating modes of an AOPD must be defined according to the risk analysis of a machine.

#### **Automatic / Protective mode**

The protective mode switches the AOPD outputs to an ON state (protection field not interrupted), without external release of a switching device. This mode of operation creates an automatic machine restart if the protection field is not interrupted and should only be selected with the restart interlock of the machine.

#### **Restart interlock (manual reset)**

The restart interlock (manual reset) prevents an automatic enabling of the outputs (OSSD's ON state) after switch-on of the operating voltage or an interruption of the protection field. The system switches the outputs only to an ON state, when an external command device generates an enabling signal at the restart input (receiver).

#### **Restart interlock with double acknowledgement/reset**

In applications with access monitoring, a complete overview of the hazardous areas is often not possible; despite that, a reset of the command device for the restart interlock outside of the hazardous area by third parties is enabled at all times. This hazardous situation of an unexpected start-up can be avoided by means of a double reset, i.e. integration of one command device inside and one outside the hazardous area.

#### **Setting mode**

Before commissioning an AOPD, the best possible alignment of the sensors should be determined. The set-up mode visualises the set-up quality during the installation of the sensors. Visualisation is via a 7-segment display, a status display or optionally via a smartphone with the "SLC Assist" app.

## OBJECT BLANKING

- 1 Object blanking area
- 2 Movable object

For safe production, object blanking can be used to blank just part of the protection field. This makes it possible to add objects, e.g. workpieces, or position a conveyor belt with a fixed position in the protection field.

With integrated movable object blanking (floating blanking) of the SLC440/445 light curtains, up to 2 light beams of the light curtain can be blanked flexibly. This function is required if there is a need to be able to interrupt light beams in the protection field at a position that is not specifically defined.

Different blanking functions are available. The distinguishing feature of the different modes is the number of light beams that can be interrupted by an object. In addition to that, it can be defined whether the object may be in the protection field permanently or only temporarily. The interrupted light beams can be at any position in the protection field.

## MUTING

If goods or objects need to be transported in or out of the hazardous area without stopping the machine, the safety light curtain must be automatically and temporarily suspended. Two or four muting signals are used to detect whether a person is approaching the hazardous area or a transport system is entering or leaving the hazardous area. Suitable muting inputs are light barriers, proximity switches or position switches.

The integrated safety-muting controller of the safety light curtain or light grid monitors and controls the muting process. The safety outputs are not disabled. Depending on the application, different light barriers with integrated muting functions are available.

# OPTOELECTRONIC SAFETY DEVICES

## SAFETY DISTANCE

### SAFETY DISTANCE

The stopping time for the complete system and the resolution capacity of the AOPD essentially determines the required safety distance of the AOPD to the dangerous area. The safety light grid or light curtain must be sized and installed so that a stop signal would be transmitted and the hazard ceased prior to a person or a body part accessing the danger zone.

The standard ISO 13855 provides the user with detailed information about the calculation of the minimum safety distances. These include the following important influencing factors:

- Stopping time of the entire system, taking the different reaction times of the individual systems into account (e.g. machine, safety relay module, AOPD etc.)
- Detection capability of the AOPD to detect body parts (finger, hand and whole body)
- Arrangement of each protection device in the normal position (vertical mounting), parallel orientation (horizontal mounting) or at any angle in front of the guard system
- Approach speed to the protection field

For the calculation of the minimum safety distance  $S$  to the hazardous area, EN ISO 13855 presents the following general formula:

$$S = K \times T + C$$

Key:

**S** the safety distance to the hazardous area (mm)

**K** the approach speed of the body or the body part (mm/s)

**T** total reaction time of the system (s)  
(inc. machine run-on time, reaction time of the safety guard and the safety relay module, etc.)

**C** additional distance (mm) before the safety guard

If access to the hazardous area (by passing across the protection field) cannot be excluded by using vertically mounted contactless protective equipment such as a light grid, an additional minimum distance  $CRO$  should be considered.

This distance is dependent on the protection field height above the ground and the position of the hazardous area (EN ISO 13855).

# tec.nicum

excellence in safety

## **tec.nicum – Developed services relating to the machine safety and industrial safety**

In the Schmersal Group, tec.nicum is the department for services relating to machine and industrial safety. The experts at tec.nicum implement all manner of safety-related projects for their customers – from analysis of the status quo through planning and documentation to the final handover of the finished, standard-compliant machine.

tec.nicum offers companies a global network of TÜV Rheinland-certified Functional Safety Engineers, so that the services of the international tec.nicum organisation can be accessed quickly and easily wherever the customer is located. tec.nicum experts not only have a sound knowledge of the applicable regional and national guidelines, laws and ordinances, they also have the technical know-how and extensive experience in project implementation.

The experts at tec.nicum aim to offer customers competent, product and manufacturer-neutral advice and support them in analysing and designing their machines and workplaces to comply with the standards.

For all of its consultancy and solution strategies, tec.nicum sets great store by objectivity.

The range at tec.nicum covers four columns: learning in the **academy** section, consultancy services in the **consulting** section, designing safety solutions in the **engineering** section and practical implementation in the **integration** section.

The head office of the tec.nicum organisation, which operates all over the world, is in Wuppertal, Germany.

 **SCHMERSAL**

# THE SCHMERSAL GROUP

## PROTECTION FOR MAN AND MACHINE

In the demanding field of machine safety, the owner-managed Schmersal Group is one of the international market leaders. The company, which was founded in 1945, has a workforce of about 2000 people and seven manufacturing sites on three continents along with its own companies and sales partners in more than 60 countries.

Customers of the Schmersal Group include global players from the area of mechanical engineering and plant manufacturing as well as operators of machinery. They profit from the company's extensive expertise as a provider of systems and solutions for machine safety. Furthermore, Schmersal specialises in various areas including food & beverage, packaging, machine tools, lift switchgear, heavy industry and automotive.

A major contribution to the systems and solutions offered by the Schmersal Group is made by tec.nicum with its comprehensive range of services: certified Functional Safety Engineers advise machinery manufacturers and machinery operators in all aspects relating to machinery and occupational safety – and do so with product and manufacturer neutrality. Furthermore, they design and realise complex solutions for safety around the world in close collaboration with the clients.

### SAFETY PRODUCTS

- Safety switches and sensors, solenoid interlocks
- Safety controllers and safety relay modules, safety bus systems
- Optoelectronic and tactile safety devices
- Automation technology: position switches, proximity switches

### SAFETY SYSTEMS

- Complete solutions for safeguarding hazard areas
- Individual parametrisation and programming of safety controllers
- Tailor-made safety technology – be it for individual machines or a complex production line
- Industry-specific safety solutions

### SAFETY SERVICES

- tec.nicum academy – Seminars and training
- tec.nicum consulting – Consultancy services
- tec.nicum engineering – Design and technical planning
- tec.nicum integration – Execution and installation
